ABSTRACT:

A navigation apparatus is equipped with a position acquisition section for acquiring positional information on a self-position, a map hold section for holding a map, and a central control section. The central control section functions as a first display control section for reading out the map containing the self-position from the map hold section and then causing display section to display the map containing the self-position, and also functions as a second display control section for setting a target spot at an arbitrary natural feature on the earth or arbitrary position within the map displayed on the display section and then causing the display section to display the target object. Furthermore, the central control section functions as an event generation section for generating a predetermined game event when the self position arrives at the target spot, or is within a predetermined allowable range, or moves around a predetermined range, and functions as a game process section for performing a game process in response to the generated game event.

ABSTRACT:

A treasure hunt type game that utilizes global positioning satellite ("GPS") equipped wireless communications devices. Players are given clues or directions to proceed along one of many predetermined treasure hunt routes based on their location as determined by the GPS. Based on these clues or directions, players change their locations. Based on these changed locations, as determined by the GPS, additional clues or directions are given to the players until one of the players completes the treasure hunt route and arrives at the treasure to win the game. The game also incorporates other variables in determining the clues to provide to players, such as the location of other players as determined by their GPS devices, the previous locations of the player and other players and whether the player has correctly solved certain clues.

ART-UNIT: 362

PRIMARY-EXAMINER: Issing; Gregory C.

ATTY-AGENT-FIRM: Pemberton; John D.

ABSTRACT:

A travel guide device includes a GPS receiver for determining a present location. Access to a database of points-of-interest, indexed by GPS location, is provided to permit timely presentation of audio narration or visual display of information relevant to the point-of-interest. A running, general area narrative and/or display may alternatively be provided. The travel guide device may provide educational and entertaining games, including interactive competitive games, relating to the points-of-interest and general area narratives. A navigation function includes automatic, intelligent collection of waypoints and general directions without stored, detailed maps of an area for which directions are being provided. Waypoint collections may be employed to document a route travel, to retrace the route, or for other purposes. A directory of locations such as restaurants, filling stations, and the like may be accessed by the travel guide device to determine GPS coordinates for a desired destination for general directions navigation. Communication facilities integrated into the travel guide device provide optional communications services, such as downloading a local directory for an area being entered.

ABSTRACT:

A game can be played using pagers and a paging system. Game participants receive information and clues from the paging system directing them to a particular landmark or location. Once there, the participants signal the system with a response which is dependent on their being at the correct location. The paging system then additionally determines that the participant is transmitting from roughly the correct location. When the participant is thus verified as being at the correct location, the next clue is transmitted to the participant. This continues until a participant correctly deciphers all the clues and arrives at the end of the game.
